Joint Event Management Information System

The Joint Event Management Information System (JEMIS) represents a Web-based application that facilitates the tracking of personnel for conferences, exercises, and other events. JEMIS makes the processing of incoming and outbound personnel much easier by:

- Creating a "joint manning document" to track personnel for conferences, exercises, and other events;
- Matching personnel requirements against occupational specialties of participants;
- Validating if a person is approved to participate in an event;
- Providing visit instructions for event participants;
- Automating the administrative processing of incoming and outgoing personnel;
- Tracking meal costs;
- And providing online reports and queries for administrative personnel;

JEMIS is a prime example of leveraging technology to process personnel faster, saving time and money. The use of these technologies is a hallmark of the transformational efforts ongoing at USJFCOM.
